

Project template

Implement the following tasks to solve the problem:

1. Read the dataset
2. Fill missing values
3. Identify the wrong values
4. Drop outliers
5. Convert objects to numeric data (Identify using LabelEncoder, OneHotEncoder or get_dummies)
6. Describe your output
7. Describe your analysis by plots
8. Calculate the correlation between features
9. Set input and output
10. Transform input by preprocessing (StandardScaler) and describe the process
11. Fit and predict model by Logistic Regression, KNN, SVC, Random Forest Classifier and Boost if necessary
12. If necessary, use GridSearchCV
13. Use clustering methods to evaluate the relationship between 2 features
14. Evaluate and describe your conclusion
